DynamoDB > Tables > Create table

Table details Info

DynamoDB is a schemaless database that requires only a table name and a primary key when you create the table.

Table name

This will be used to identify your table.

clase17/02/2026

Between 3 and 255 characters, containing only letters, numbers, underscores (_), hyphens (-), and periods (.).

Partition key

The partition key is part of the table's primary key. It is a hash value that is used to retrieve items from your table and allocate data across hosts for scalability and availability.

artista | String

1 to 255 characters and case sensitive.

Sort key - *optional*

You can use a sort key as the second part of a table's primary key. The sort key allows you to sort or search among all items sharing the same partition key.

tirulo cancion | String

1 to 255 characters and case sensitive.

Table settings

- ○ Default settings
  The fastest way to create your table. You can modify most of these settings after your table has been created. To modify these settings now, choose 'Customize settings'.
- ◉ Customize settings
  Use these advanced features to make DynamoDB work better for your needs.

Table class Info

Select table class to optimize your table's cost based on your workload requirements and data access patterns.

Choose table class

- ○ DynamoDB Standard
  The default general-purpose table class. Recommended for the vast majority of tables that store frequently accessed data, with throughput (reads and writes) as the dominant table cost.
- ◉ DynamoDB Standard-IA
  Recommended for tables that store data that is infrequently accessed, with storage as the dominant table cost.

Read/write capacity settings Info

Capacity mode

- ◉ On-demand
  Simplify billing by paying for the actual reads and writes your application performs.
- ○ Provisioned
  Manage and optimize your costs by allocating read/write capacity in advance.

▶ **Maximum table throughput - *optional***

Specify maximum on-demand read or write (or both) throughput for tables and secondary indexes to help keep your throughput usage and costs bounded. By default, maximum table throughput does not apply and on-demand throughput is only limited by the default DynamoDB table quotas.

Warm throughput Info

Increasing the warm throughput value pre-warms your table to handle planned peak events without throttling or scaling delays. By default, warm throughput values are visible for all tables and global secondary indexes. These values automatically adjust as you increase your provisioned throughput or on-demand consumption without extra charges, but if you choose to change them manually, additional charges apply. Read units per second

- ◉ Keep default values
- ○ Increase warm throughput

Protect your DynamoDB table from accidental writes and deletes
When you turn on point-in-time recovery (PITR), DynamoDB backs up your table data automatically so that you can restore to any given second in the preceding 1 to 35 days. Additional charges apply. Learn more
