Amazon Athena

Analytics

Amazon Athena

Start querying data instantly.

Amazon Athena is an interactive query service that makes it easy to analyze data in Amazon S3 and other federated data sources using standard SQL.

Get started

- Query your data in Amazon SageMaker Unified Studio
Run and schedule queries in a single data and AI development environment.
- Query your data in Athena console
Use Query editor to analyze data on S3, on premises, or on other clouds.

The screenshot shows the AWS Management Console interface for creating a new alarm. The breadcrumb navigation at the top indicates the path: CloudWatch > Alarms > Create alarm. On the left, a vertical progress bar shows four steps: 'Specify metric and conditions', 'Configure actions', 'Add alarm details' (which is currently selected and highlighted with a blue circle), and 'Preview and create'. The main content area is titled 'Add alarm details' and contains two sections. The first section, 'Name and description', has a text input for 'Alarm name' containing 'mi alarma ec2-sajo'. The second section, 'Alarm description - optional', has a text area with the description 'supero el 50%'. Below the text area, a character count indicates 'Up to 1024 characters (13/1024)'. At the bottom of the description section, a blue-bordered box contains a note: 'Markdown formatting is only applied when viewing your alarm in the console. The description will remain in plain text in the alarm notifications.' The console's top bar shows the AWS logo, a search bar, and account information for 'United States (N. Virginia)' with account ID '6546-5447-8122'. The bottom of the image shows a Windows taskbar with the system clock at 21:29 on 20/02/2026.
